Features The main features of AutoCAD are the ability to edit and modify 3D and 2D drawing files; view the drawing in various 2D or 3D perspectives; connect 2D or 3D objects with geometric and topological relationships; specify

and measure drawing objects and areas; export and print drawings; generate and print 3D models and animations; and connect CAD files to external database and web-based applications. Project space view of a 2D drawing. From AutoCAD Community Wiki. AutoCAD Basic User Interface The default user interface for AutoCAD is the ribbon, which is similar to the standard toolbars used in Microsoft Word. The ribbon reduces the number of menus and options required to access commands, as

well as the number of buttons on the screen, which minimizes the number of visual distractions on the screen. The ribbon can be customized to suit your preferences and work habits. The ribbon is activated by clicking on the "Ribbon" button in the top toolbar. You can customize the ribbon by selecting your preferred customizations. The AutoCAD ribbon consists of the following sections: Drawing Tools: These tools are used to create, edit and manipulate drawing objects. View:

The View tool is used to view and change the properties of 2D drawings. Home tab: This tab is the main work area. It contains the following buttons: Pan, Zoom, Transform, Save: These buttons work on the current drawing. Home, Arrange, Zoom, Zoom 3D, Options, View 3D, Help, History, Close: These buttons work on the entire drawing, including previously open drawings. Window: The Window tool is used to adjust the size of drawings and the display of other drawings. Grip: This tool is used to

adjust the layout of drawing objects on the screen. Ribbon Options: The Ribbon Options button is used to open the ribbon customization dialog, which you can customize as required. Help: This button displays help topics for AutoCAD. File: This button opens the file menu. Window: This button opens the window menu. The following ribbon buttons

software This invention relates to an
apparatus for continuously

controlling the temperature of
moving bodies, and more

particularly to an apparatus for
detecting the temperature of a

moving body in a manner to prevent
temperature drift of the moving

body from occurring and correcting the detected temperature for its proper temperature control. When a moving body, for example, a lead roll, is driven at a constant speed, it is necessary that the temperature of the moving body be constantly detected, its temperature be regulated, and the regulated temperature be maintained even if there are thermal variations in the moving body. A first conventional temperature-control apparatus is shown in FIG. 1. The apparatus is provided with a casing 1 having a

passage 1A therein, a temperature-control liquid 2 sealed in the casing 1, and a thermistor 3 of which temperature corresponds to that of the temperature-control liquid 2. In operation, the thermistor 3 is caused to face the passage 1A and transmit heat from the passage 1A to the thermistor 3. The temperature of the thermistor 3 is displayed on
