The software allows you to transfer any number of tables from PostgreSQL to SQLite. It includes wizards that can guide you through a single table and a series of tables. Thus, you may define a single transfer based on the selected table and a series of transfers based on the selected tables. After you have set the preferences and selected the required tables, you may run the transfer process by clicking the Run button. The software includes a wizard that can walk you through the whole transfer process as well as a preview area where you may preview the final result. The application supports the creation of any structure you may require, by checking the relevant tables in the source database. Moreover, it allows you to export the information in any format you may require, including single table and series of tables. Thus, the software includes wizards that assist you by using the built-in query tools or by providing you with the necessary query parameters. The software can perform direct information transfer between two different database formats. It works with PostgreSQL and SQLite. Thanks to the wizards, it can guide you through all the steps involved with table transfer. The software supports the creation of any table structure as well as single-table and series of table transfers. Thus, with the wizards and database managers configuration, it may be used for conversion between other database formats. The software includes wizards to assist you with single table and series of tables. You may start or stop the process, select the tables to be migrated as well as check them for export. Once you have selected your preferences, you may schedule a task for later execution. The preview area allows you to test the final result. **Advanced Features:** This advanced release of PostgresToSqlite can perform direct transfer between PostgreSQL and SQLite. It features wizards that can guide you through a single table transfer and a series of tables. The software supports the creation of any table structure as well as single-table and series of table transfers. Thus, with wizards and database managers configuration, it may be used for conversion between other database formats. The wizard that is used for single table and series of tables is adjustable in size. You can decide how many wizard pages to include, as well as specify the number of wizard components (i.e., table heading/column, row detail, etc.). The application supports: Conversion of single tables Conversion of series of tables Conversion of tables with a layout of a row of multiple columns Import of CSV files

PostgresToSqlite is a simple to use and highly customisable application for simple and efficient data migration from PostgreSQL to SQLite. This data conversion software is a small wizard that allows you to transfer table rows from a specific schema to a specific table. This software, which is available for both Windows and Linux, requires a direct connection to both database managers in order to enable specific segment of information to be controlled. This customizable tool has many built-in features that help you perform simple and efficient database migration, such

as:

- Data transfer wizard through several alternative processes.
- Data migration wizard that can help you through all the steps of a specific transfer method.
- Previewing area that allows you to manually configure each table you migrate.
- Previewing tables and rows that you select for migration.
- Data can be transferred by appending existing information in the destination table, by replacing it or by updating it.
- Data transfer wizard can be set to run or schedule a later time.
- Table settings for configurations can be saved in order to set them to the default options.
- Table settings for configurations can be saved in order to set them to the default options.
- Tables can be compared in order to select the rows that should be migrated.
- Tasks can be launched and executed independently.
- The software supports scheduling tasks for single or recurrent execution. This version features a number of enhancements in both the developer and user interfaces. These changes are intended to improve the overall experience while providing a simpler, more stable, and more effective platform for development and maintenance. The updates include features that support the new.NET 4.0 version and an improved query planner that can improve data retrieval.

PostgreSQL to SQLite is a data migration tool with a friendly wizard-based interface. It migrates data from PostgreSQL to SQLite using any of the following ... SivaSoft Grid for PostgreSQL SivaSoftGrid for PostgreSQL is a lightweight and fully automated tool that assists the PostgreSQL administrator in creating many reports that can be used for monitoring the cluster. It includes numerous real-time reports that can be viewed by clicking the links on the page. Reports can be generated with a single click of the buttons provided on the toolbar. They are generated from queries and can be used for monitoring connections, physical database size, table statistics, indexes, group permissions, table permissions, available disk space, configured alerts, connections and more. Reports can be generated as HTML, PDF, CSV, Excel or XML. SivaSoftGrid for PostgreSQL Features: 1. Frequently asked queries and reports available in the real-time tracking feature. 2. Generate reports in the PDF format from any query. 3. Supports regular and full-text indexes in XML and SQL as well as regular and full-text tables. 4. Supports the following databases: Oracle, SQL Server, Sybase, MSSQL, MySQL, PostgreSQL, Informix 5. You can perform a backup and restore operations to the following databases: Oracle, SQL Server, Sybase, MSSQL, MySQL 6. You can save reports in different forms, such as HTML, SQL, CSV, XML. 7. Load only data from the specified tables into the database. 8. Search for the specified text in all selected tables. 9. Generate check/ audit reports for each table. 10. Generate reports for specific classes of objects, such as tables, indexes, views, primary keys, sequences, triggers, views. 11. Filter your report on any field specified. 12. Select the fields for export in HTML format. 13. Export the report into a HTML file. 14. Export the report into a PDF file. 15. Generate a report with the specific field names. 16. Can generate reports with fields of any table created in any database. 17. Compatible with SQL server, Oracle, MySQL, Sybase and MS-SQL (2005 and 2008) versions. 18. Can generate reports for only tables. 19. Reports can be generated from many queries in one click. 20. Allows you to generate

PostgresToSqlite is simple to use and facilitates the direct information transfer between two database formats. The software specializes in transferring data from PostgreSQL to SQLite, through several alternative processes. Thanks to the wizard functions, it can guide you through all the steps of the data migration even if you do not have extended SQL knowledge. The software features a separate wizard that can help you through all the steps of each transfer method. Thus, you may migrate a single table, a series of tables or define the source of the transfer via query, all with the guidance of the wizard. The software requires that you connect to both database managers, in order for you to be able to control a specific segment of information. Thus, you can select the desired tables and rows that you wish to transfer, from one of the existing particular schemas. Moreover, you need to select the exact destination where you wish the data to be transferred. Indicating the exact source and

destination is why a direct connection to both databases is required. In the case of single table transfer, you may even create a new destination structure in the receiving database. The application allows you to configure each table you transfer, by checking the rows for export and unchecking those that should be ignored. Previewing areas allow you to manually configure the tables, as well as peek at the final result. The data can be transferred by appending the existing information in the destination table, by replacing it or by updating it. Alternatively, you may create a SQL query in order to define the source of a transfer or to control the entire process. Once you have set all the preferences, you can save the current session, then run or schedule it for a later time. The software supports scheduling tasks for single or recurrent execution. Configuration: You may transfer data between PostgreSQL and SQLite databases through a few different methods, each of which includes several steps to follow. Thus, the software provides a detailed guide for each process. The application utilizes several options, each of which can be configured separately, but is also able to modify specific options for the entire session. They can be configured by going to File -> Preferences, but you may also use the wizard to configure all options in just a few steps. The supported options are : - Schema : the schema where the transfer will take place. - Schema source: the schema from which you wish to transfer a segment of data. - Schema destination: the schema to which you wish to transfer a
